*"Christian brings both technical excellence and great team spirit...
He picks up complex topics fast and always delivers on goals."*

— Brianna Mersey, VP Data

HOW I THINK

Systems First

Every problem is a system. Map inputs, outputs, feedback loops, constraints, and failure modes before code. Build the smallest architecture that satisfies them.

Typed Work > Vanity Metrics

Orchestration differentiates WORK from CONTROL signals. Measurement clarity prevents metric inflation.

Constrained Autonomy

[GOVERNANCE]

Agents operate within identity boundaries, context budgets, rate limits, and pre-execution policy gates. Safety, evaluation, and dispatch layers enforce bounded execution.

THE APPROACH

- ① **DIAGNOSE** Map the system
- ② **BOUND** Define constraints
- ③ **ORCHESTRATE** Wire the agents
- ④ **INSTRUMENT** Measure everything
- ⑤ **DEPLOY** Ship to production
- ⑥ **ITERATE** Eval-driven loops

INTERESTED IN

Applied AI systems where autonomy is governed by explicit boundaries and measurable outcomes – orchestration, deployment under real-world constraints, and evaluation-driven iteration.

CERTIFICATIONS

- GCP Professional Data Engineer
- GCP Professional Cloud Architect

PRODUCTION SYSTEMS

Rezzed.ai

bounded-multi-agent-orchestration
Claude Code. Role-specialized agents in Planner □ Worker topology. Typed task lifecycles (WORK vs CONTROL), identity-scoped boundaries, context monitoring, static token ceilings, pre-tool-use policy gating. Vendor-neutral backends.

CacheBash

mcp-relay + persistent-task-state
Cloud Run, transactional claiming. TTL-based relay, dead-letter containment, identity isolation, audit logging at tool boundary. Separates productive work from control traffic.

OptiMeasure

privacy-first-ai-measurement
Vertex AI cookieless attribution. Modeling latency: 6 months □ 6 weeks. Clean-room compatible.

Bourlier.ai

constraint-aware-deployment
Production testbed. Gemini + rate limiting, validation, audit logging, structured output handling.

- ```
// instrumentation.underway
```
- Completion semantics (SUCCESS / FAILED / SKIPPED)
  - Retry classification + error taxonomy
  - Token, cost, latency rollups per task class
  - Prompt/output provenance hashing
